

Comparing community mobility reduction between first and second COVID-19 waves

Gabriela Cavalcante da Silva, Fernanda Monteiro de Almeida, Sabrina
Oliveira, **Elizabeth F. Wanner**, Leonardo C. T. Bezerra, Ricardo H. C.
Takahashi and Luciana Lima
Transport Policy

September 3, 2021

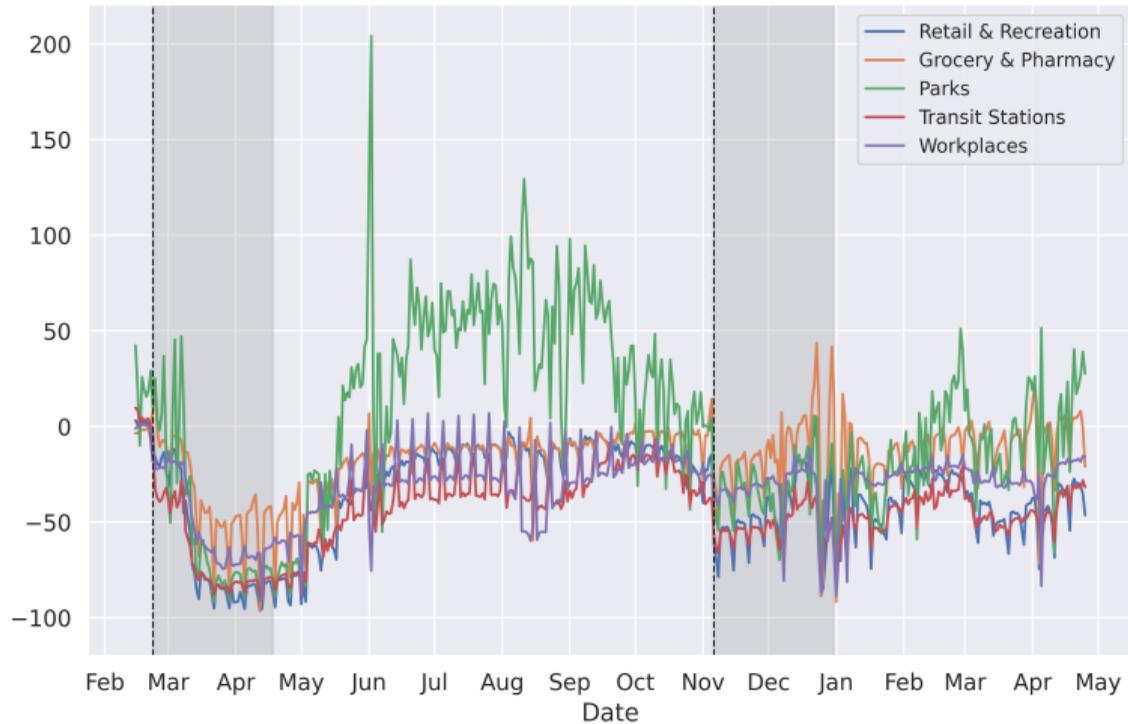

- Using Google CMR, mobility reduction rate comparison between the first and second COVID-19 waves in
 - Lombardia, Italy
 - Île de France
 - Birmingham, UK
 - Manaus, Brazil
 - Berlin, Germany
 - Toronto, Canada
- Multi-dimensional visualization considering multiple place categories for each selected locality ⇒ Pareto-compliant conclusions
- For each temporal granularity (56-day and 14-day consecutive windows), data is aggregated using the area under the curve (AUC) approach

¹G. Cavalcante da Silva, F. M. de Almeida, S. Oliveira, E. F. Wanner, L.C.T. Bezerra, R. H.C. Takahashi, L. Lima, Comparing community mobility reduction between first and second COVID-19 waves, *Transport Policy*, V. 112, 2021, pp 114-124,

Category	Places
<i>Grocery & pharmacy</i>	Grocery markets, food warehouses, farmers markets, specialty shops, drug stores, and pharmacies
<i>Parks</i>	Parks, public beaches, marinas, dog parks, plazas, and public gardens
<i>Transit stations</i>	Public transport hubs, e.g. subway and bus stations
<i>Retail & recreation</i>	Restaurants, cafes, shopping centers, theme parks, museums, libraries, and movie theaters
<i>Residential</i>	Places of residence
<i>Workplaces</i>	Places of work

Wave	Lombardia	Île-de-France	Toronto Division	Berlin	Birmingham District	Manaus
<i>1st</i>	Feb 23rd	Mar 12nd	Mar 12nd	Mar 13nd	Mar 13nd	Mar 16th
<i>2nd</i>	Nov 6th	Oct 30th	Nov 21st	Nov 2nd	Nov 5th	Dec 26th

Google recommends:

- 1 calibrating data in a locality-wise basis;
- 2 handling noise incurred by holidays or other exceptional circumstances;
- 3 balancing the difference in magnitude between categories.

What we have done:

- 1 processing the whole time series for each locality and place category to ensure that the data previous to the 1st wave present zero mean;
- 2 isolating data trend from weekday seasonality effects and noise using seasonal-trend decomposition by loess (**STL**);
- 3 balancing the contribution of individual place categories (data for each category is scaled to a common range per locality.)

Locality	Wave	Parks	Retail & recreation	Transit stations	Workplaces	Schools

(b) Toronto Division

- Reduction rates observed during the 1st wave were much higher than during the 2nd.
- December holiday season mobility in some of the localities reached pre-pandemic levels.
- Manaus was the only locality where 2nd wave mobility was nearly as reduced as during the 1st wave, likely due to the P1 variant outbreak and oxygen supply crisis.

Thank You!
